Example of Plotting or Measuring Bearings on the Map
Using Grid North as the North Reference
In this example the bearing is 70° Grid

- Rotate the compass dial so that 70° is at the index line.
- We're not using the magnetic needle in our compass.
- Instead we are aligning the parallel lines, in the compass capsule, with the Grid North reference lines on the map.

Folding and cutting instructions

- #1 Turn the sheet over, fold in half on the dotted line, so the letter "A's" touch.
- #2 Fold the sheet in half again on the #2 fold line, so the letter "B's" touch.
- #3 Cut the sheet using the marks at the #3 cut line.
- #4 Cut the sheet using the marks at the #4 cut line.

Compass and Map Plotting use different north references. Conversion is required.

Compass (M) to Map (G)
Grid = Compass (M) + 3.5°

Map (G) to Compass (M)
Compass (M) = Grid - 3.5°

Local Magnetic Anomalies

In some areas there may be significant localized magnetic fields typically caused by magnetic rock deposits such as iron ore or lava flows. 3-4 degrees of anomalous declination is common near these areas. In extreme cases a compass may be rendered useless.

It is a good idea to confirm the local declination by comparing compass sighted and map plotted bearings between two known points.
